

As a professional over-the-road truck driver the instant traffic is a fantastic asset. Not only can plan your route while you're miles away from an urban area, you can also make adjustments while you're there. If you are heading to a major urban area, where do you tune into to find traffic conditions? A uniform information system to cover most of the major metroploitan areas is a godsend. While traveling a large area, the weather channel covers a general overview of what's to be expected, which is helpful. For more precise weather, the local National Weather Service transmitters do a fine job. Information covering traffic and weather is a critical part of my job. Please don't change a uniform system of providing me with that information. Thank You Bruce Wagner
